

Bugs Fixed:

Michael:

Players getting stuck in newly spawned NPCs:

- If a customer spawned on top of the player, they would be frozen and unable to move.
- This was because the system would detect the collision and keep the player from continuing to move in any overlapping direction.

Fix:

- Added logic to check for overlapping between newly spawned customers and the players foot rectangle(hitbox) and bump the player upward when detected.

Game crashing when attempting to take an order with no customers in line:

- The player could open the register screen and attempt to take an order even when there were no customers in line. This would result in the game crashing.
- This is because the system would try to perform order-taking operations with no data because there is no order to take.

Fix:

- Properly implemented the register property “customerWaiting”. “customerWaiting” is set to True when there are customers in line and set back to False when line is empty. Now, when the player attempts to open the register, the system checks if `register1.customerWaiting == True` and doesn’t allow register screen to open (game state to change) if not True.

Mario:

- Infinite Orders could be accepted when all seats were full. Fix:
 - Added a check in the accept order handler that counts active orders and compares it against `max_orders`. If the limit is reached, a message is displayed and the order is rejected before any seat or cup logic runs. Added a sperate check that looks for an open seat via `findirstOpen(seats)` before finalizing the order, displaying “No open seats available” and halting if none exist.
- Customers would teleport to their seats instead of walking to them. Fix:

- Added a two-stage walk system to the Customer class. When an order is accepted, `set_targetSeat()` assigns an intermediate `targetPosition` waypoint in front of the seating area. The customer first enters the “waling to table” state and moves to the waypoint, then transitions to “finding seat” where `findSeat()` uses `move_toward_point()` to walk them smoothly to the exact seat one step at a time.
- Pressing ‘R’ while in debug mode to reset wouldn’t fully reset everything. Fix:
 - Updated the `K_r` key handler to clear both the customers and `customersWaiting` lists, call `clear_round_state()` to wipe internal game manager state, reset the shared `customerWaiting` flag to false, and set `currentCust` back to None, ensuring no stale references to old customer objects remained after the reset.
- Customers in line did not get closer to the counter as they moved forward. Fix:
 - Updated `LINE_POSITIONS` in `constants.py` so each successive position in the line has a progressively smaller Y value, moving customers visually closer to the register as they advance toward the front.
- The game would crash when a customer's wait timer expired and they left. Fix:
 - Added a `cleanup_gone_customers()` method in `GameManager` that safely removes customers in the “gone” state from all tracking lists (`customers`, `customersWaiting`, `all_sprites`, `customer_group`) and null out their resolved order references. This prevents the game loop from iterating over or acting on customer objects that no longer exist.

Lavisha: The water Boiler machine is not aligned with other machines position. And when entered in mini game mode when the machine states changes the size changes as well, so that needs to be fixed.

Fix:

Taylor:

When customers would leave, they would float off screen in their sitting positions

Fix:

- Added logic that if their state is not sitting; their sprite is updated to idle again.

Ground coffee didn't stack when entering minigame mode, collecting, brewing, and collecting again all at once.

Fix:

- Added a check in player's add item function to determine if the item passed was an input, and if so, would be able to stack to other inputs in the inventory.

Could pick up boxes in the backroom even if there wasn't inventory space.

Fix:

Added check for if the player's add item function returned False (indicating an open or stackable spot was not found in the inventory) then the box wouldn't be added, and a tip would display to let the player know.

When the drink was delivered, it stayed in the inventory.

Fix:

- Added a code segment to the delivery section that would remove the drink from the inventory once it was delivered and update the quantities.

Order taking could happen if there was a customer in the line, even if they were not up to the register yet.

Fix:

- Changed the register customer waiting attribute to only be True if there was a customer in the front line position, not in the "moving up in line" state. The register icon displays and an order can be taken only when a customer is at the register now.

When an empty cup is grabbed, it stacks on a cup with contents.

- Double check this still works once coding again!

Fix:

- Check that both items are stackable in the player's add item function.

Time continued to accumulate when the game was on a menu screen.

Fix:

- Added check for menu states where the game seconds are calculated in the game loop.
